
stores all cluster data
The core Kubernetes services
CLUSTER
CONTROL PLANE
scheduler
etcd
controller-manager
ensures desired state, if a pod dies it creates a new one
Decides where to run the pods
api server
The "brain" that handles api requests
Agent that runs on each worker nodes to manage pods
Node 1
Node 2
Node 3
kubelet
kube proxy
pod
CRI
Node components
A plugin interface enabling kubelet to use container runtimes without having to recompile cluster components. It is the main protocol for communication between kubelet and container runtime
container runtime is the software responsible for running containers
